

Want to save time and money on your FBT?

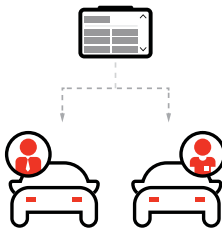

Technology, such as EROAD's electronic FBT Logbook can help make your FBT claims more accurate and cost effective when using the Operating Cost FBT method.

Here's how EROAD's electronic FBT Logbook works:

Step 1 Drivers enter a passcode when they get in the vehicle, which enables time and distance to be automatically recorded against their name.

Step 2 The driver also selects the purpose of their trip – either business or personal – which is then stored in the telematics platform. Unlike a paper logbook, EROAD's electronic FBT Logbook can also highlight when a driver hasn't logged their trip.

Step 3 Data is captured in real-time on EROAD's single in-cab device – EHUBO2. It also records advanced analytics data on a range of other metrics to help with the safety and compliance of your fleet as well as identify areas for efficiencies.

Step 4 Once the trip is complete, it is recorded and stored for the requisite period and is quick to recall and audit, when needed.
